

ABSTRACT OF THE DISCLOSURE

An operation for selecting a desired one of images can be simplified. Still image data sets are sequentially read from a recording medium according to order of file names and displayed on a TV. Upon display, the still image data sets are in a non-selection state. If an instruction is not input from a remote controller within a predetermined time since the display of one of the still image data sets, the still image data set being displayed is set to a selection state and the following still image data set having the file name that comes next is displayed. If an instruction is input from the remote controller for display of the following still image data set within the predetermined time, the still image data set being displayed is left in the non-selection state, and the following still image data set is displayed.
